

DBS Battery Replacement Instructions:

1. Pull Tab before using DBS packs for the first time to enable battery connection.
2. After removing Tab, use the test button, to confirm that batteries are making proper connection. The LED will glow green.
Note: The battery life of the 6 X 12V batteries in each DBS pack is basically the same as the shelf life of the battery, as there is no current draw in DBS system, other than when the test button is activated. These batteries will last for years.
Note: When battery replacement is eventually needed (the green LED fails to light) replace with commonly available 27A 12V Alkaline batteries.
3. Remove the end cap of the DBS pack by gently wedging a fine blade screw drive in the indentations and flexing the cap off.
4. Remove old batteries
5. Replace with 6 X new 27A 12V Alkaline batteries. Be sure to follow the + and – direction shown on the cartridge.
6. Snap the end cap back in position.
